

Quality Management

The Client's Watchdog

Sandberg provides top level Quality Management services to Property Developers and Financiers for both new construction and for renovation.

For Quality Assurance to be effective on site, all members of the construction team have to understand and implement their own quality plans, procedures and controls. Failure to apply QA only becomes evident after costs, delays and conflict have already escalated.

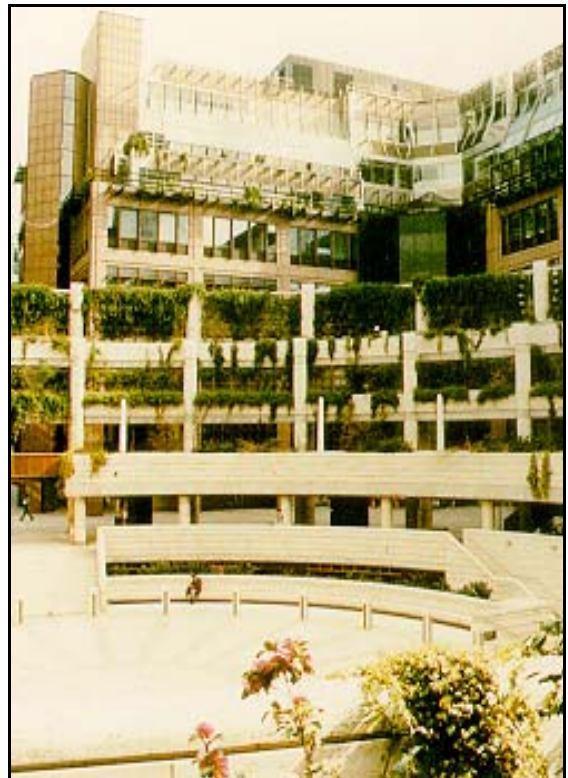

Sandberg acts in an audit capacity to ensure that QA systems are in place, that they are being used properly and will give early warning to the Client when they are not. In this way problem areas are more quickly identified and help and support can be organised where most needed.

The Sandberg role of 'Client's Watchdog' is a relatively new general concept but is one which has already been well proven in London over the last few years. It is made possible by the breadth of Sandberg's comprehensive supporting services.

Quality assurance and quality management apart, services offered include materials and durability consultancies, specification advice, on-site quality control, vendor assessment, inspection and investigation, all designed to meet the individual client's technical requirements and budgetary limits.

The services are provided worldwide for building and civil engineering projects of any size, on and off-site, at steelwork fabricators, precast or other suppliers' works. They are supported by our extensive UKAS accredited Laboratories in London and from on-site laboratories.

Post-construction services include performance or damage defect surveys and investigations, for both engineering and commercial purposes, for which a wide range of non-destructive and other techniques is available.

Broadgate, City of London

Client: Rosehaugh Stanhope Developments plc
